the 1990s, the number of people in the world who are undernourished has increased from 600 million to 800 million.

There are a number of reasons for this increase. One of the main reasons is that the world population has increased from 5 billion in 1987 to 6 billion in 1999, and is projected to reach 8 billion by 2025.

Another reason is that the world's food production has not kept pace with the increase in population. In 1987, the world produced enough food to feed 6 billion people, but by 1999, it was only enough to feed 5.5 billion people.

There are a number of factors that have contributed to this decline in food production. One of the main factors is the depletion of the world's natural resources, such as soil and water.

Another factor is the increase in the number of people who are living in urban areas, which has led to a decrease in the amount of land available for agriculture.

There are a number of ways in which we can address these issues. One of the main ways is to improve the efficiency of our food production systems.

Another way is to protect the world's natural resources, such as soil and water, from depletion.

There are a number of other ways in which we can address these issues, such as increasing the number of people who are living in rural areas, and increasing the amount of land available for agriculture.

It is important that we take action now to address these issues, as the world's food production is projected to decline further in the coming years.

There are a number of ways in which we can address these issues, such as increasing the efficiency of our food production systems, protecting the world's natural resources, and increasing the number of people who are living in rural areas.

Table 1. Mean (SD) age, height, weight, and body mass index (BMI) of the participants in each group

Group	Age (years)	Height (cm)	Weight (kg)	BMI (kg m ⁻²)
Control	12.1 (0.4)	150.5 (6.5)	42.5 (10.5)	18.9 (3.2)
Low-dose	12.1 (0.4)	150.5 (6.5)	42.5 (10.5)	18.9 (3.2)
High-dose	12.1 (0.4)	150.5 (6.5)	42.5 (10.5)	18.9 (3.2)

Control = no treatment; low-dose = 10 mg/kg/day of 17 β -oestradiol; high-dose = 20 mg/kg/day of 17 β -oestradiol. BMI = body mass index.

Table 2. Mean (SD) age, height, weight, and body mass index (BMI) of the participants in each group

Group	Age (years)	Height (cm)	Weight (kg)	BMI (kg m ⁻²)
Control	12.1 (0.4)	150.5 (6.5)	42.5 (10.5)	18.9 (3.2)
Low-dose	12.1 (0.4)	150.5 (6.5)	42.5 (10.5)	18.9 (3.2)
High-dose	12.1 (0.4)	150.5 (6.5)	42.5 (10.5)	18.9 (3.2)

Control = no treatment; low-dose = 10 mg/kg/day of 17 β -oestradiol; high-dose = 20 mg/kg/day of 17 β -oestradiol. BMI = body mass index.

Table 3. Mean (SD) age, height, weight, and body mass index (BMI) of the participants in each group

Group	Age (years)	Height (cm)	Weight (kg)	BMI (kg m ⁻²)
Control	12.1 (0.4)	150.5 (6.5)	42.5 (10.5)	18.9 (3.2)
Low-dose	12.1 (0.4)	150.5 (6.5)	42.5 (10.5)	18.9 (3.2)
High-dose	12.1 (0.4)	150.5 (6.5)	42.5 (10.5)	18.9 (3.2)

Control = no treatment; low-dose = 10 mg/kg/day of 17 β -oestradiol; high-dose = 20 mg/kg/day of 17 β -oestradiol. BMI = body mass index.
